

Chapter 6 / **Example 11****Modelling with power functions**

A designer wants to create a model function for a bowl that she sketched by hand in order to be able to process it digitally. To do so, she put the sketch over a grid and marked some data points, with the centre of the bottom of the bowl being the origin.

The data points are the following:

Point	A	B	C	D	E	F	G	H	I
x	-16.5	-15.1	-14	-12.8	-11.3	-9.3	-7.5	-5.3	0
y	7	4.9	3.62	2.53	1.54	0.7	0.3	0.07	0

Point	J	K	L	M	N	O	P	Q
x	5.3	7.5	9.3	11.3	12.8	14	15.1	16.5
y	0.07	0.3	0.7	1.54	2.53	3.62	4.9	7

- Plot the given data on your GDC or other technology.
- She first thought of using a quadratic function to model the shape.
- Explain with your reasoning why a quadratic function could be suitable to model this shape.
 - Use your GDC to determine the quadratic model function for this set of data.
 - Assess the choice of model by determining the coefficient of determination.
 - Sketch the model function over the scatter plot and comment on the closeness of fit to the original data.
- Not being satisfied with the model function she created, she decided to determine a new quartic model function.
- Explain why the designer might have not been satisfied with the model function she created and why a quartic function could be a suitable alternative model.
 - Use your GDC to determine the quartic model function for this set of data.
 - Assess the choice of model by determining the coefficient of determination, comparing it to the previous model.
 - Sketch the model function over the scatter plot and comment on the closeness of fit to the original data and compare it to the previous model.

Press **MENU** 2 **STAT** to display the List Editor screen.

Enter the x -coordinates in the first column.

Press **EXE** after each number to move to the next cell.

	List 1	List 2	List 3	List 4
SUB				
1	-16.5			
2	-15.1			
3	-14			
4	-12.8			
				-12.8
GRAPH CALC TEST INTR DIST ▶				

Chapter 6 / **Example 11****Modelling with power functions**

Press **▶** to move to the next column.

Enter the y -coordinates in the second column.

	List 1	List 2	List 3	List 4
SUB				
1	-16.5	7		
2	-15.1	4.9		
3	-14	3.62		
4	-12.8	2.53		
				2.53
GRAPH CALC TEST INTR DIST ▶				

Press **F1** GRAPH.

Press **F6** SET.

Choose Graph Type: **F1** Scatter, XList: List1 and YList: List2.

```

StatGraph1
Graph Type : Scatter
XList      : List1
YList      : List2
Frequency   : 1
Mark Type   : □
Color Link  : Off
GRAPH1 GRAPH2 GRAPH3
  
```

Press **EXIT**.

Press **F1** GRAPH1.

The GDC displays a scatter diagram of x against y .

Because the data is approximately quadratic, quadratic regression is appropriate.

To calculate the equation of the regression line

Press **F1** CALC and press **F4** X^2 .

The quadratic curve is given by the equation
 $y = 0.0263x^2 - 1.15$.

The coefficient of determination is $R^2 = 0.933$, which shows strong association.

```

QuadReg
a = 0.0262669
b = 0
c = -1.1498077
r² = 0.93267862
MSe = 0.43524086
y = ax² + bx + c
COPY DRAW
  
```

Press **F6** DRAW.

The GDC displays the scatter diagram and the quadratic function.

Although the model function goes through (or close to) most points, it still misses the bottom point by a significant amount.

Press **EXIT** twice then press **F1** GRAPH1.

Press **F1** CALC and press **F6** \triangleright **F1** X^4 to calculate quartic regression.

The quartic function is $0.0000946x^4 - 0.0000649x^2 + 0.000214$.

```

QuartReg
a = 9.4626 × 10⁻⁵
b = 0
c = -6.487 × 10⁻⁵
d = 0
e = 2.1379 × 10⁻⁴
r² = 0.9999977
COPY DRAW
  
```

Chapter 6 / **Example 11**

Modelling with power functions

Press **F6** DRAW.

The GDC displays the scatter diagram and the quartic function.

The coefficient of determination is $R^2 = 0.999\dots$, which shows an almost exact fit.
